

Question 1

Objective

Structurally, we need decide how to handle rules that nullify or modify other rules?

Example: For Burnaby there is a rule that nullifies bylaw code 101.5.1 if the lot is in the in the Community Heritage Register.

Attempts

A nullify_code attribute could store bylaw codes to nullify if the penalty of the rule is applied, however, there may be a better solution using the other attributes. Using the above example, instead of introducing an “is_heritage” rule with an nullify_code attribute, we could just have a heritage related condition on other rules.

Evidence

All documentation is in a Google Sheet (rule structure is on first page):

https://docs.google.com/spreadsheets/d/1-LSJ6LMKjTPDwhcj8C_DAUa8Fo60dhvHENCIL2PLTBQ/edit?usp=sharing

Diagnosis

This issue came up because of the way bylaws are written. Heritage clauses could be treated as conditions for other rules, but this information is quite disconnected in the bylaw documentation. For example, heritage clauses can affect max lot coverage, but all heritage information is in its own separate section, different the section with most other lot coverage information.

Proposed Next Steps

We believe there is no need for a nullify_code attribute (or something similar) to nullify or modify other rules.

Decision Ask

We are looking for input on which approach you think is better: a nullify_code rule attribute, or extra conditions on rules to handle clauses that that nullify or modify other rules.
